

# Green Plastic

2021-06-04

In these years, Green Plastic has been one of the hottest topic all around the world. Besides the general plastics materials we are selling, we are also actively developing the new Green Plastic in order to bring the positive change to the global warming. And now, there are majorly three categories of Green Plastic in the nowadays market:

**Recyclable Plastic** – To recycle the discard plastic product & reprocessed into recycled plastic. It would help to reduce carbon dioxide emissions during the production process.

**Renewable Plastic** – To produce this plastic with the natural & renewable resources. The usage of limited resources can be decreased as well as reducing the carbon emissions during the production process.

**Biodegradable Plastic** – To produce this plastic from materials that do not contain the components of the traditional plastic. Also, it can be decomposed into carbon dioxide and water by the action of microorganisms, water & oxygen under the soil.

As for plastic waste, most of the countries have also implemented policies and regulated the amount of discarded plastics and under developing the different types of Green Plastic to replace petroleum-based plastics in order to make the change for the future of the earth and our next generation.
